WDS · ENTERPRISE

WDS-E & Agent Space

The universal memory layer that makes agents scale.

PRESENTED TO

Chris Woodill · Apply Digital

BY

Mårten Angner · April 22, 2026

Your teams adopted AI.
The coordination problem got worse.

> *Design team tends to think in Figma, the strategy team tends to think in Miro boards and documents. Both of which are not AI enabled.*

— CHRIS WOODILL · MARCH 26

> *Very meeting heavy.*

— CHRIS WOODILL · MARCH 26

01

Three tools, zero connection

Claude, GPT, Copilot — each brilliant alone. Together, three silos with no shared memory.

02

Every session starts from zero

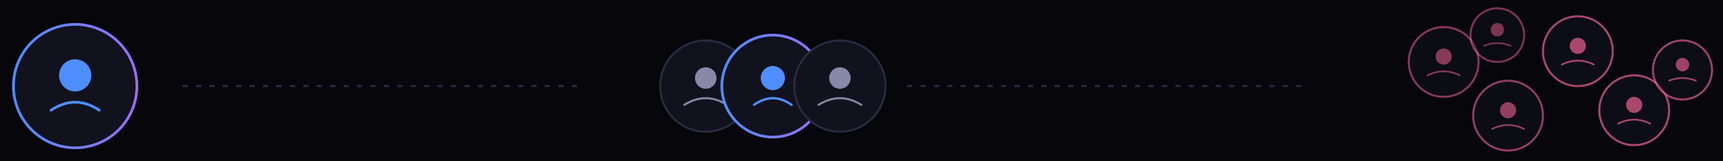
Decisions made Tuesday are unknown to the agent on Wednesday. Your people carry the context.

03

Humans needs to keep it all together!

That's the bottleneck — and adding more AI tools makes it worse.

BMad is a game-changer for the solo builder. It is not built for scale.



Solo builder

1 PERSON · 1 REPO

Small team

3–5 PEOPLE · N REPOS

40+ people

NO SHARED STATE

01

Agents live in repos, not in sync

Every team member has their own version. Different prompts, different behaviors, no shared state.

02

No framework for your own agents

BMad ships its standard agents. Building custom means starting from scratch every time.

03

Not built for scale

Clone repos, copy files, manual setup per machine. Not something you roll out to 40 people across London and EMEA.

THE PROBLEM AT SCALE

The more AI you adopt, the more coordination overhead you generate.

TRAP 01

The Figma Trap

Design sees AI output, takes it to Figma, spends weeks on pixel perfection. The code is already there. The habit wins.

TRAP 02

The Miro Trap

Strategy thinks in boards and documents. Smart people, great thinking — in formats no agent can act on.

TRAP 03

The Meeting Trap

Every handoff between strategy, UX, and development is a meeting, a summary, a Confluence page nobody reads.

Three teams, three tools, no connection. **Add more AI tools, add more coordination overhead** — unless you install a layer that handles it.

Agent Space is the missing piece between teams, tools, and agents.

01

Not a tool. A layer

Agent Space sits below your tools and agents, holding everything they produce.

02

Work flows without meetings

Saga posts a brief. Freya picks it up. Mimir builds. No one emails anyone.

03

Memory is organizational, not personal

Every decision is available to every agent in every future session.

Every asset you deliver — Agent Space knows how it got there.

INGEST
Kickoff Call
Structured brief

Meeting saved as semantic meaning

PHASE · STRATEGY
Saga
Brief + trigger map

Session insights saved, shared with Freya

PHASE · UX
Freya
Scenarios · wireframes

User taste saved, handed over to Mimir

PHASE · DEV
Mimir
Tech audit · build

Dev insights saved in Agent Space

NEXT PROJECT
/start
Zero onboarding

100% context
0% onboarding

THE DELIVERABLE

Product briefs. UX scenarios. Architecture decisions. In the repo, available to every agent.

THE REASONING

Why that direction. What was rejected. What the client said that changed it. Stored alongside the output — not lost in Slack.

THE PAYOFF

Six months later, a new strategist picks up the client. They see what was built — and understand why.

01 · CATEGORY

Setup.

Governance · Policies · Implementation · Users. Where the conversation with IT and Compliance starts.

Governance is the starting point, not an obstacle.

ORGANIZATION

OUTCOMPETE THE UNDECIDED

Strategic advantage

Your method, encoded as a system.
Decisions inside a signed frame.
Leave the debating agencies behind.

INDIVIDUAL

EVERYONE LEVELS UP

Personal potential

Seniors do senior work.
Juniors get senior leverage from day one.
Talent joins where work gets bigger.

OVERSIGHT

COMPOUND, DON'T CONSUME

Operational sustainability

Costs under control.
Customer service superior at scale.
Advantage that compounds, not burns.

WHAT AI MUST NOT DO

Risk mitigation

Data AI cannot touch.
Actions it cannot take.
Models not on the approved list.

HOW THINGS SHOULD BE DONE

Best practices

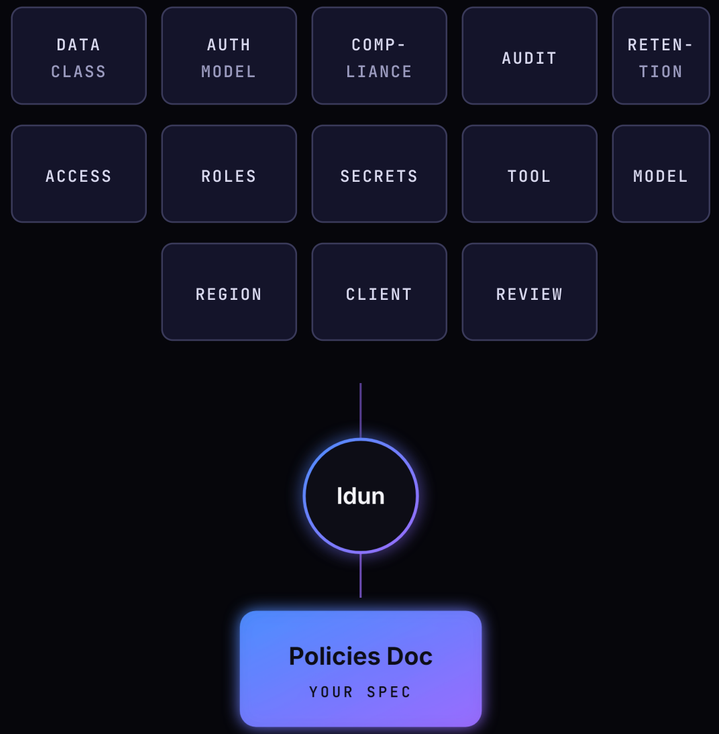
Prompt patterns and review gates.
Escalation paths for human judgment.
The craft, codified.

SOMEONE IS WATCHING

Compliance

Monitoring that never sleeps.
Audit trail for every decision.
Rules you set, and rules you must meet.

13 policies. One conversation.
The complete specification for your system.



01 · INPUT

13 policies. One conversation.

Idun walks through data classification, authority model, compliance framework, audit requirements — all of it.

02 · OUTPUT

A document uniquely yours

Not a generic AI policy. A document that reflects the exact shape of your organization.

03 · THE TWIST

It's the build spec, not documentation

Every agent, every skill, every access boundary is generated from it.

Your policies become the implementation specs.

DATABASE

Database-agnostic

Based on your chosen technology stack, in accordance with the access and compliance defined.

- MS SQL Server
- Oracle
- Postgres / Supabase
- MySQL

REFERENCE

Data storage in correct region

Schema, edge functions, row-level security. GDPR by architecture. Stockholm.

- EU · Stockholm
- EU · Frankfurt
- US · Virginia
- APAC · Singapore

RESULT

Bespoke by design

Apply Digital's Agent Space couldn't be sold to another company. It was generated from a document that couldn't be copied.

- Universal memory
- Agent communication
- Coordination
- Meeting management
- Skills, tools & templates
- Secure layer

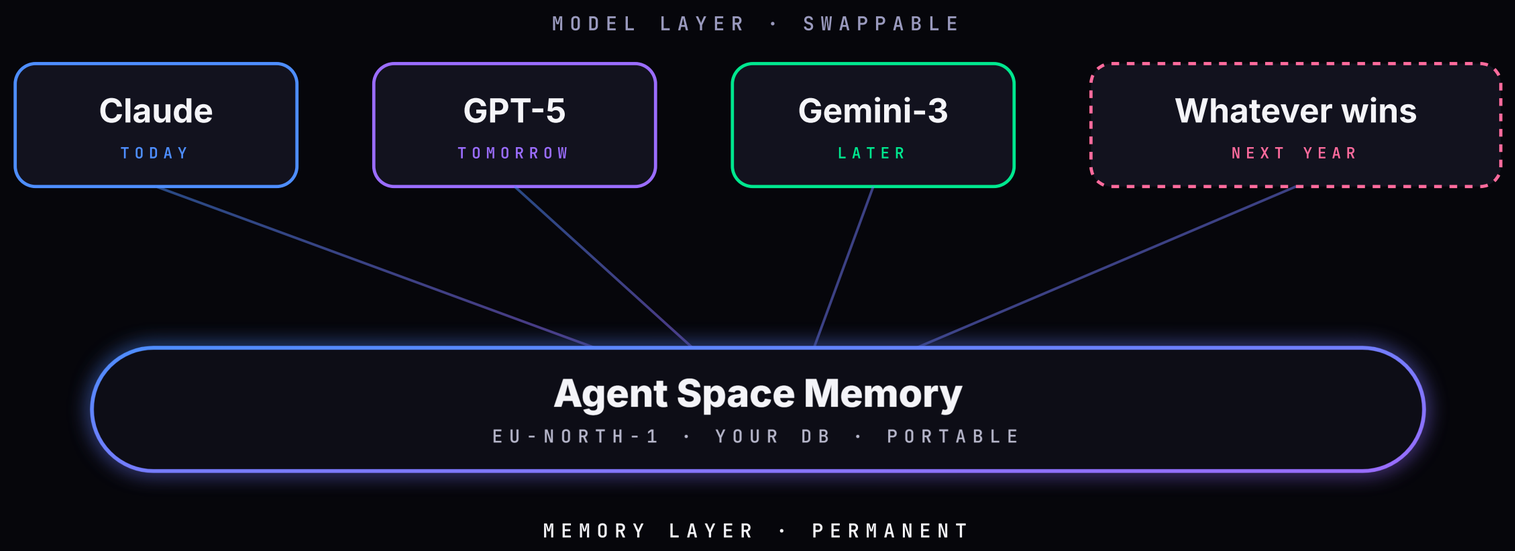
JUST LIKE BMAD The engine is the same. The policies become the code.

02 · CATEGORY

Universal Memory.

The layer that outlasts every LLM generation. Every decision, every session, every project — yours, persistent, portable.

Your memory outlasts every LLM generation.



01

Every other tool starts from zero

ChatGPT, Claude, Copilot — each session forgets the last. Your team re-briefs the AI every time.

02

Agent Space remembers everything

Every decision, every client, every project — searchable semantically, available to every agent.

03

You own it

When the next model is 30% better, you swap. The memory stays in your infrastructure. You are not a tenant.

Every session builds on the last.

SESSION · SAGA · 14:28

```
saga / /wrap
# capturing session state…

decisions:
  • chose triggers over personas
  • excluded US segment (cost)
  • rejected 3 alternate framings

outputs: brief-v2.md · trigger-map.json
blockers: waiting on client legal review
handoff: → freya (UX)

✓ stored in agent-space (30s)
```

01

/wrap takes 30 seconds

Decisions, outputs, blockers, context for next time — structured, tagged, stored.

02

Without it, the context evaporates

Tomorrow starts from a blank page. Again.

03

With it, continuity is structural

The next strategist opens Saga. She already knows what was decided — and why the three alternatives were rejected.

The agent arrives briefed.

01

/start loads everything

Project, decisions, meeting transcripts, the person's own context — before the first message.

02

Zero onboarding meeting

A new developer joins week 6. /start. Mimir knows the tech stack, the constraints, what's been built.

03

This kills the meeting-heavy problem

Briefings exist because humans carry context between sessions. Remove that — meetings collapse back to decisions.

SESSION · MIMIR · DAY 1

```
mimir / /start
# loading context for aaron (week 6 dev)

✓ project apply-digital / commerce-relaunch
✓ tech stack next.js · supabase · vercel
✓ 47 decisions from weeks 1-5
✓ 12 meeting transcripts
✓ soul.md for aaron
✓ last wrap from mimir (yesterday 18:12)

ready. what would you like to build?

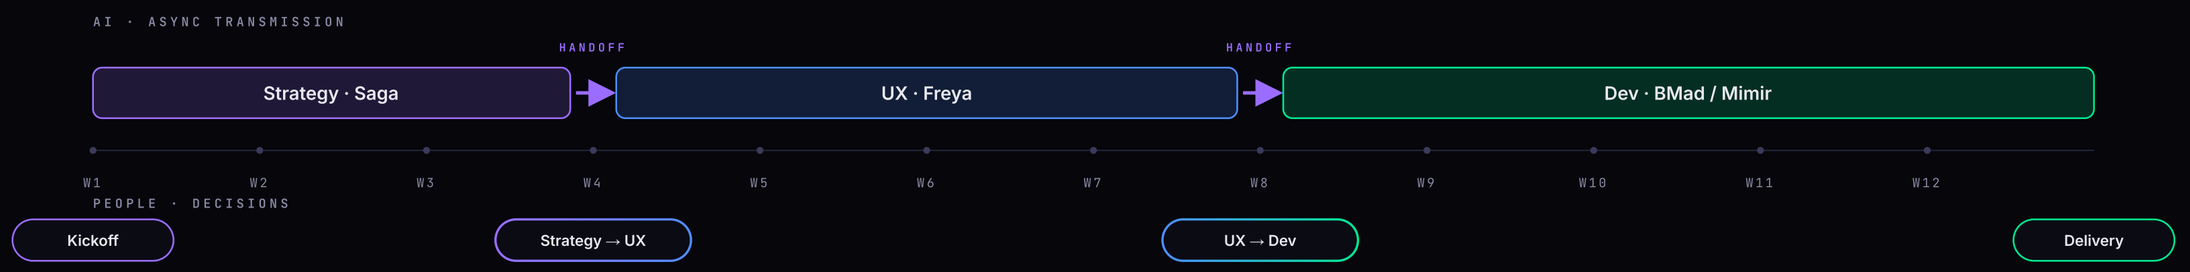
aaron /
```

03 · CATEGORY

Coordination.

Meetings collapse when the tissue between them is structural, not human.

People meet to decide.
AI handles the transmission.



01

No coordination meetings

Saga finishes a brief, posts a structured handoff to Agent Space. Freya picks it up next session.

02

No Confluence pages

Every handoff is structured, tagged, findable — not a Slack thread buried on Thursday.

03

Every phase knows the last

Strategy (wk 1–3) → UX (4–7) → Dev (8–12). Twelve weeks, three disciplines, zero information meetings.

Visibility at the work level — across every agent in flight.

01

Every task has a status

`ready → in-progress → done / blocked`. Nothing falls through the cracks.

02

Project lead sees everything

Three simultaneous engagements. All active work orders. No status meeting needed.

03

Right now you have zero visibility

10 people using AI tools across an engagement — you don't know what any of them are doing until they report in.

04 · CATEGORY

Meeting Intelligence.

Every call a permanent asset. Your AI attends every one.

Every meeting, permanent and searchable.
Your AI attends every one.

Ask Agent Space
ANSWERS

01

When a call ends, Agent Space receives it

Chunked, semantically indexed, connected to people, projects, and clients.

02

This is how I prepared for today

March 26 — 44 minutes. Your exact words. I didn't re-read notes. I asked Agent Space.

03

Six months from now

A new strategist takes over an Apply Digital client. They ask the agent. The agent knows.

05 · CATEGORY

Skills, Tools, & Platform.

The difference between AI adoption and AI capability.

SLIDES 17 – 22

The difference between AI adoption and AI capability.

v2.1 User research synth	v1.4 Brief structuring	v3.0 NEW Competitor scan	v1.1 A11y audit
v2.3 Wireframe drafts	v1.0 Pitch deck	v4.2 Tech audit	v2.0 Retro synthesis

IDUN · AUTO-REVIEW · versioned, audited, pushed to every agent.

ADOPTION

40 people, 40 approaches

Individuals figure out their own workflows. None shared. None improving.

CAPABILITY

One skill, every agent

Written once, reviewed by Idun, versioned, pushed to everyone.

YOUR ADVANTAGE

One research lead, forty multipliers

Every strategist — London, EMEA, pilot — runs it identically. Update centrally. Done.

DAILY OVERHEAD

5.4M

tokens per day
before your team does a single thing.

40 people × 5 sessions × 27,000 tokens
= **5,400,000 / day** — pure overhead

THE PROBLEM

Every MCP server loads at startup

27,000 tokens of tool definitions — before the agent does anything useful.

WDS-E · LAZY LOAD

Only what's needed

A Freya UX session: ~3,000 tokens instead of 27,000. Cost discipline built in.

DEFAULT MCP 27,000

WDS-E 3,000

40 people, 40 API keys, 40 breach points.
Or one credential store.

01 · ONE VAULT

Every tool. Configured once.

Fortnox, Stripe, Google Workspace, LinkedIn — in Bitwarden, centrally.

02 · NO SECRETS IN PROMPTS

Agents access through the store

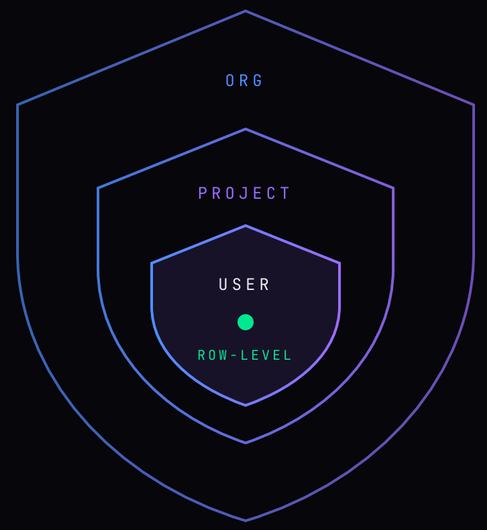
No API keys pasted into prompts. No secrets in code. No secrets in Slack.

03 · ONE REVOCATION

Cleans everything

A strategist leaves — credentials revoked in one place, 15 integrations updated simultaneously.

GDPR compliance by architecture — the review starts green.



01 · THREE LEVELS

Org, Project, User

Agents and tools at org. Client data at project. Memory at user — row-level.

02 · DATA LOCALITY

Stays in eu-north-1

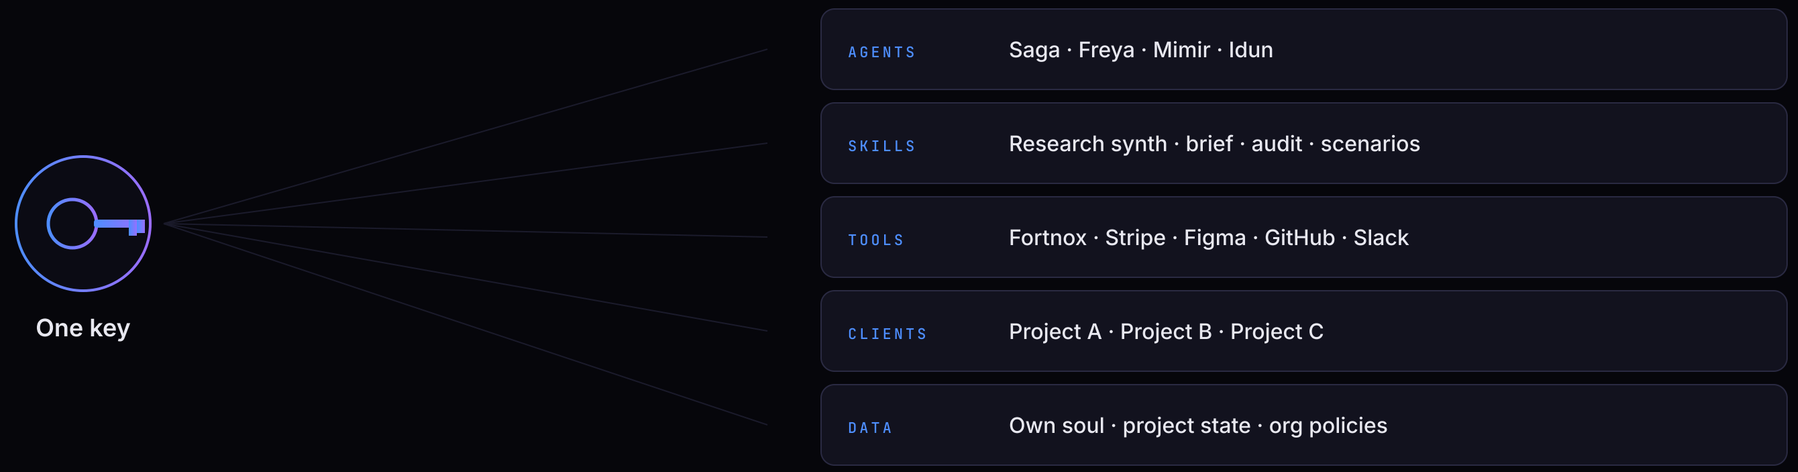
You own the database. Anthropic processes — doesn't retain. Sessions ephemeral.

03 · FINSERV READY

Isolated at project level

No bleed-through to other engagements. Passes the compliance review.

One credential in.
One revocation out.



01

Configure in conversation

Idun walks the lead through scope. Agents, skills, tools, client data — decided together.

02

Join: one setup. Leave: one revocation.

A contractor gets two projects and two skill sets. Engagement ends — one operation removes all of it.

03

IT overhead on AI tooling: eliminated

No more managing access across a fragmented tool stack.

Invite your clients in.
Keep your methodology yours.

01 · ADMIN

Admin

Configures the system. Sets policies, roles, tool access. The build spec lives here.

- Policies
- Roles
- Agents
- Skills

02 · LEAD

Lead

Directs engagements. Invites clients and contractors. Shapes the work orders.

- Projects
- WO assign
- Invites
- Output

03 · CONTRIBUTOR

Contributor

Produces. Strategists, UX, developers. Reads and writes to their project memory.

- Sessions
- Outputs
- Decisions
- Wrap

04 · VIEWER

Viewer CLIENT

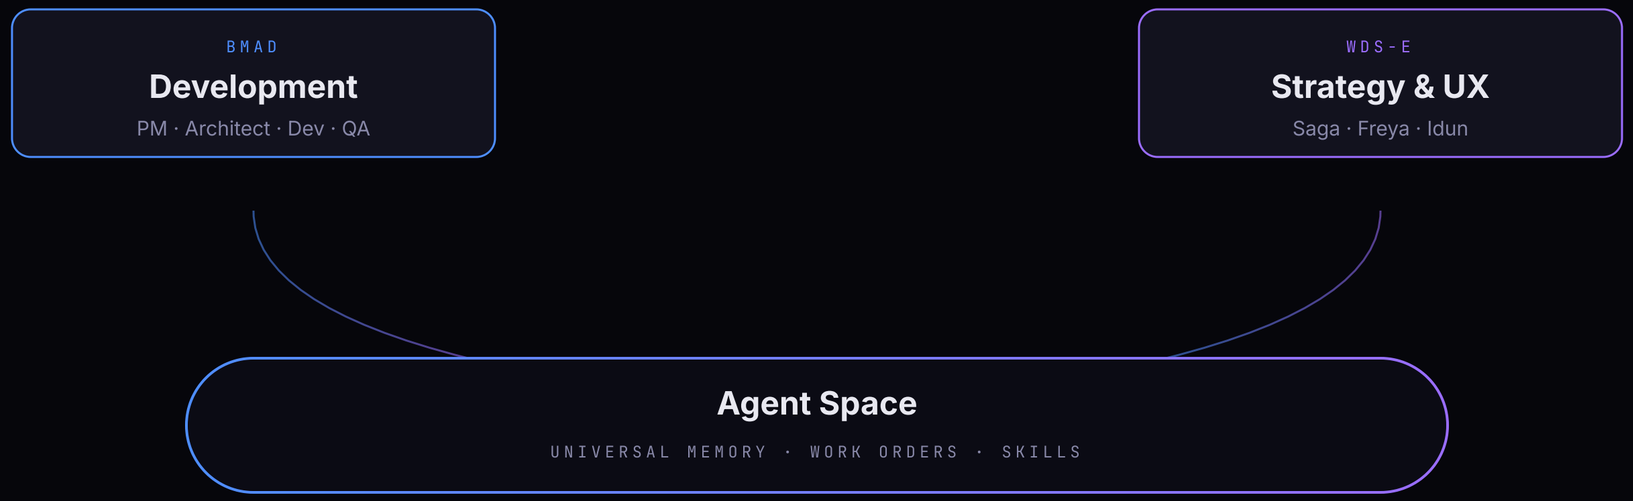
Observes. Clients see their project — outputs, WOs, decisions. Not your process.

- Outputs
- WO status
- Decisions
- ~~Methodology~~

That's a commercial advantage. You show clients the work in a way that builds trust — without exposing your process.

BMAD COMPATIBLE

BMad and WDS-E
run on the same coordination layer.



01

BMad for development. WDS for strategy and design.

Agent Space is underneath both.

02

Same memory. Same work orders.

BMad agents read from and write to Agent Space. Skills from WDS-E run inside BMad sessions.

03

You don't have to pick sides

Strategy with Saga. UX with Freya. Dev with BMad. All three write to the same Agent Space.

THE LOCK-IN ARGUMENT

The model makers don't want you to do this.

THEIR MODEL

OpenAI	Anthropic	Google
MEMORY	PROJECTS	GEMS

Your data in their infrastructure

You can't take it with you. You can't share it across vendors. Not an oversight — the business model.
Every insight you generate makes you more dependent.

WDS-E · YOUR MODEL

Claude | GPT-5 | Gemini | next

Your memory · your database · eu-north-1

Your database. Your infrastructure. Your memory.

Any model can read it — today Claude, tomorrow GPT-5, next year whatever wins.
The insights are yours because the data is yours.

This problem will never be solved by the people who benefit from it not being solved.

NEXT STEP

Three options — you pick.

01 · PILOT

Pilot engagement

One Apply Digital client project. WDS-E full stack. Mårten embedded for the first sprint.

You see the outputs before you commit to anything larger.

ONE CLIENT · ONE SPRINT

02 · EMEA

EMEA intro

Connect me with your European lead. Partnership conversation, not a vendor pitch.

Apply Digital has the client relationships; WDS-E has the coordination layer.

LONDON · 40–50 PEOPLE

03 · CHAMPIONS

Champion program

Five people from your design team. Exclusive access. One intensive.

The results make the case internally better than any slide deck.

YOUR WORDS · MARCH 26
